                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            CC binding. They can be prepared by chemical synthesis or by use of CC recombinant DNA techniques. The peptide antagonists are used as an CC antiinflammatory agents in the treatment of gastrointestinal CC inflammation, where they bind to the ZOT receptor in the intestine CC inflammation, where they bind to the ZOT receptor in the intestine CC inflammation, where they bind to the ZOT receptor in the intestine CC intestine. Gastrointestinal inflammation conditions give rise to CC increased intestinal permeability and the peptide is useful for CC caused by infection, e.g. Clostridium difficile infection, CC caused by infection, e.g. Clostridium difficile infection, CC caused by infection, viral gastroenteritis, parasite CC infestation, bacterial overgrowth, whipple's disease, diseases with CC mucosal erosion or ulcerations; e.g. satritis, gastric cancer, CC collagenous colitis, inflammatory bowel disease, diseases marked by lymphatic obstruction, e.g. congenital intestinal lymphangictasia, CC sarcoidosis lymphoma, mesenteric tuberculosis, and after surgical CC correction of congenital heart disease with Fontan's operation, CC coeliac disease, without ulceration, e.g. Menetrie's disease, coeliac disease, without ulceration, e.g. Menetrie's disease, coeliac disease, eosinophilic gastroenteritis, and immune diseases, coeliac disease, eosinophilic gastroenteritis, and immune diseases, coeliac disease with course or food allergies, primarily to

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This present sequence is that of a peptide antagonist of zonulin (Z), one of 25 such peptides (see Y79105-29) of the invention, which bind to a zonula occludens toxin (ZOT) receptor, yet do not physiologically modulate the opening of mammalian tight junctions (TJ). The peptide antagonists are based on a common motif of ZOT and human zonulins, which is believed to be critical for receptor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   treating cerebral ischemia, stroke, cerebral edema, gastritis, shigellosis, viral gastroenteritis, meningitis, encephalomyelitis

recombinant DNA techniques. The peptide antagonists are used as an antiinflammatory agents in the treatment of gastrointestinal inflammation, where they bind to the 20T receptor in the intestine and yet does not physiologically modulate the opening of Ty in the intestine. Gastrointestinal inflammation conditions give rise to increased intestinal permeability and the peptide is useful for treating intestinal conditions that cause protein losing enteropathy caused by infection, e.g. Clostridium difficile infection, enterocolitis, shigellosis, viral gastroenteritis, parasite infestation, bacterial overgrowth, whipple's disease, diseases with
                                                                                mucosal erosion or ulcerations, e.g. gastritis, gastric cancer, collagenous colitis, inflammatory bowel disease, diseases marked by lymphatic obstruction, e.g. congenital intestinal lymphanglectasia, sarcoidosis lymphoma, mesenteric tuberculosis, and after surgical correction of congenital heart disease with Fontan's operation, mucosal diseases without ulceration, e.g. Menetrier's disease, coeliac disease, eosinophilic gastroenteritis, and immune diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        which bind to a zonula occludens toxin (ZOT) receptor, yet do not physiologically modulate the opening of mammalian tight junctions (TJ). The peptide antagonists are based on a common motif of ZOT and human zonulins, which is believed to be critical for receptor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New peptide antagonist of zonulin useful as antiinflammatory agent treating cerebral ischemia, stroke, cerebral edema, gastritis, shigellosis, viral gastroenteritis, meningitis, encephalomyelitis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        binding.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                             c and human zonulins, which is believed to be critical for receptor to binding. They can be prepared by chemical synthesis or by use of recombinant DNA techniques. The peptide antagonists are used as an antinflammatory agents in the treatment of gastrointestinal inflammation, where they bind to the zor receptor in the intestine and yet does not physiologically modulate the opening of TJ in the can recept of the strointestinal inflammation conditions give rise to increased intestinal permeability and the peptide is useful for treating intestinal conditions that cause protein losing enteropathy caused by infection, e.g. Clostridium difficile infection, enteropathy conteriors by infection, bacterial overgrowth, whipple's disease, diseases with collagenous colitis, inflammatory bowel disease, diseases with collagenous colitis, increations, e.g. congenital intestinal lymphangiectasia, esacoidosis lymphoma, mesenteric tuberculosis, and after surgical correction of congenital heart disease with Fontan's operation, and corrections at ease examinating the same with Fontan's operation, and increase systematical diseases without ulceration, e.g. Menetiler's diseases.

The peptide antagonists are based on a common motif of ZOT and human zonulins, which is believed to be critical for receptor and human zonulins, which is believed to be critical for receptor.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This sequence represents a human guanylin preprohormone which is cleaved to generate a 15 amino acid mature peptide (Y42458). This sequence is the encoded protein from a composite DNA sequence isolated by probing a human duodenum cDNA library with the corresponding rat coding sequence. Guanylin is an intestinal guanylate cyclase regulator which has similarity to bacterial heat stable enterotoxins which activate intestinal guanylate cyclases. The guanylin peptide can be used as a laxative in the treatment of constipation.

Guanylin is an intestinal guanylate cyclase regulator which has similarity to bacterial heat stable enterotox:ns which activate intestinal guanylate cyclases. The guanylin peptide can be used as a laxative in the treatment of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Peptide antagnonist FZI/O of zonula occludens toxin (zot)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 as compared to the human protein only.

The invention relates to 125 novel genes and their fragments (nucleic acid sequences: X84933-X85057; amino acid sequences Y27567-Y27933) which are useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. Also, pathological conditions can be diagnosed by determining the amount of the new polypeptides in a sample or by determining the presence of mutations in the new polypucleotides. Specific uses are described for each of the 125 polynucleotides, based on which tissues they are most highly expressed in (see X84933 for described needs)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          25-JUL-2000
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Y84661;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Y84661 standard; Protein; 8

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This sequence represents a secreted human protein encoded by the gencione detailed in the descriptor line. The gene can be used to gencion proteins by linking to the gene to a human immunoglobulin Fc portion (e.g. x84924) for increasing the stability of the fused proteins by the stability of the fused proteins by the fused proteins (e.g. x84924) for increasing the stability of the fused proteins are sequenced.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       uses).

The method comprises administering to the host an effective amount of a 20t-related immunoregulator selected from 20t (zonula occludens toxin) zonulin, the amount effective to down-regulate the activity of the APC.

recombinant DNA techniques. The peptide antagonists are used as an antiniflammatory agents in the treatment of gastrointestinal inflammation, where they bind to the ZOT receptor in the intestine and yet does not physiologically modulate the opening of TJ in the intestine. Gastrointestinal inflammation conditions give rise to increased intestinal permeability and the peptide is useful for treating intestinal conditions that cause protein losing enteropathy caused by infection, e.g. Clostridium difficile infection, enterocolitis, shigellosis, viral gastroenteritis, parasite infestation, bacterial overgrowth, whipple's disease, diseases with
                                                                                            collagenous colitis, inflammatory bowel disease, diseases marked by lymphatic obstruction, e.g. congenital intestinal lymphangiectasia, sarcoidosis lymphoma, mesenteric tuberculosis, and after surgical correction of congenital heart disease with Fontan's operation, mucosal diseases without ulceration, e.g. Menetrier's disease, coeliac disease, eosinophilic gastroenteritis, and immune diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      that bind to a zonula occludens toxin (ZOT) receptor, yet do not physiologically modulate the opening of mammalian tight junctions (TJ). The peptide antagonists are based on a common motif of ZOT
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This present sequence is that of a peptide antagonist of zonulin, corresponding to residues 8-15 of human foetal intestinal zonulin. It is one of 25 peptide antagonists (see Y79105-29) of the invention that bind to a zonula occludens toxin (ZOT) receptor, yet do not
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Claim 1;
                                                                                                                                                                                                                                                   mucosal erosion or ulcerations, e.g. gastritis, gastric cancer,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       shigellosis, viral gastroenteritis, meningitis, encephalomyelitis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New peptide antagonist of zonulin useful as antiinflammatory agent treating cerebral ischemia, stroke, cerebral edema, gastritis,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      binding.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              human zonulins,
                                                                          systemic lupus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The peptide antagonists are based on a common man zonulins, which is believed to be critical
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 They can be prepared
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Page 45;

The peptide antagonists are based on a common mottif of ZOT cand human zonulins, which is believed to be critical for receptor (CD binding. They can be prepared by chemical synthesis or by use of crecombinant DNA techniques. The peptide antagonists are used as an antiinflammatory agents in the treatment of gastrointestinal confinement of the ZOT receptor in the intestine can determine the potential synthesis or by use of creased intestine. Gastrointestinal inflammation conditions give rise to increased intestinal conditions that cause protein losing enteropathy caused by infection, e.g. Clostridium difficile infection, c.g. congenital gastroenteritis, parasite concessal erosion or ulcerations, e.g. gastricts, gastric cancer, collegeous colitis, inflammatory bowel disease, diseases with concessal diseases without ulceration, e.g. sastricts, and after surgical correction of congenital heart disease with Fontan's operation, colling constitution, e.g. wenettries, and after surgical concellac disease, eosinophilic gastroenteritis, and immune diseases, colling systemic lupus erythematosus or food allergies, primarily to colling the colling systemic lupus erythematosus or food allergies, primarily to continue the colling primarily to colling the colling primarily to continue the colling primarily to colling the colling primarily to c

CC molecular weight of 47 kD, as determined by SDS-PAGE, which is CC molecular weight of 47 kD, as determined by SDS-PAGE, which is CC recognised by both anti-tau polyclonal antibody and by anti-zonula CC occludens toxin (ZOT) polyclonal antibody, and is capable of reversibly CC opening mammalian tight junctions. Zonulin proteins function as CC physiological modulators of mammalian tight junctions. They can be used CC for enhancing the absorption of therapeutic agents across tight junctions of intestinal and nasal mucosa and across tight junctions of Legal punctions of intestinal and nasal mucosa and across tight junctions of CC ce.g. lidocaine, adenosine, dobutamine, dopamine, epinephrine, norepinephrine, phentolamine, doxapram, alfentanil, dezocin, nalbuphine, CC comprenorphine, naloxone, ketorolac, midazolam, propofol, metacurine, CC mivacurium, succinylcholine, cytarabine, mitomycin doxorubicin, cetoxitin, cefenicid, cefmetazole and arreconam, a hormone e.g. cultoristine, vinblastine, methicillin, mezlocillin, piperacillin, cotoxitin, cefenicid, cefmetazole and arreconam, a hormone e.g. testosterone, nandrolene, menotropins, insulin, urofolitropin, cotoxitin, can also be used for the production of antibodies which can be used to assay for zonulin in body tissue or fluids, or in affinity-copatities of zonulin. The present sequence represents an N-terminal copatities of zonulin.

Primers JO2, JO3, JO4, JO14 and VH1BACK (Q62765-Q62769) were all used to prepare cDNAs that encode the BrE-3 mouse Ig variable domains. The amplified V-regions lacked constant regions so as to produce less immunogenic polypeptides. A hybrid polypeptide was prepared using human constant regions with the murine V regions. The chimeric polypeptide retained the binding affinity of BrE-3 for human milk fat globule. The amino acid sequences deduced from the amplified VL and VH regions were compared to N-terminal sequences which had been determined directly (i.e. R52792 and

This present sequence is that of a peptide antagonist of zonulin (C12), one of 25 such peptides (see Y79105-29) of the invention, CC which bind to a zonula occludens toxin (ZOT) receptor, yet do not CC physiologically modulate the opening of mammalian tight junctions CC (TJ). The peptide antagonists are based on a common motif of ZOT CC and human zonulins, which is believed to be critical for receptor binding. They can be prepared by chemical synthesis or by use of CC recombinant DNA techniques. The peptide antagonists are used as an antiinflammatory agent; in the treatment of gastrointestinal CC inflammation, where they bind to the ZOT receptor in the intestine CC and yet does not physiologically modulate the opening of TJ in the CI intestine. Gastrointestinal inflammation conditions give rise to concreased intestinal permeability and the peptide is useful for treating intestinal conditions that cause protein losing enteropathy CC caused by infection, e.g. Clostridium difficile infection, caused by infection, e.g. Clostridium difficile infection, bacterial overgrowth, whipple's disease, diseases with CC collagenous colitis, inflammatory bowel disease, diseases marked by

and numan zoncuture, mind and human zoncuture, minding. They can be prepared by chemical synthesis or by use or recombinant DNA techniques. The peptide antagonists are used as an antiinflammattory agents in the treatment of gastrointestinal inflammation, where they bind to the ZOT receptor in the intestine and yet does not physiologically modulate the opening of TJ in the intestine. Gastrointestinal inflammation conditions give rise to increased intestinal permeability and the peptide is useful for increased intestinal conditions that cause protein losing enteropath
                                                                                                                                                  This present sequence is that of a peptide antagonist of zonulin (2), one of 25 such peptides (see Y79105-29) of the invention, which bind to a zonula occludens toxin (ZOT) receptor, yet do not physiologically modulate the opening of mammalian tight junctions (TJ). The peptide antagonists are based on a common motif of ZOT and human zonulins, which is believed to be critical for receptor binding.
                                                                                                                                                                                                                                                                                                    New peptide antagonist of zonulin useful as antiinflammatory agent for treating cerebral ischemia, stroke, cerebral edema, gastritis, shigellosis, viral gastroenteritis, meningitis, encephalomyelitis
                                                                                                                                                                                                                                                                                                                                                                              WPI; 2000-205565/18
